

Caller ID ActiveX Control

Last Updated Tuesday, 23 January 2007

Our Caller ID ActiveX control is a reliable ActiveX component which delivers caller ID information from your TAPI device to your Windows applications. This control allows the developer to instantly add pop-up style caller ID support to Visual Basic, Visual C++, and a host of other applications with minimum memory and processing overhead.

The control supports multiple lines reliably and is designed to raise events when calls arrive.

The Caller ID ActiveX control is available with source code included for \$199, or \$99 for just the redistributable OCX.
